MEMORANDUM

TO: Fish and Wildlife Committee members

FROM: Jim Ruff – Manager, Mainstem Passage and River Operations

SUBJECT: Presentation on the PIT tag forecaster tool for the Columbia River Basin

BACKGROUND:

Presenters:

Presenters will include Jim Geiselman (Environmental Engineer at BPA) and Al Giorgi (Bioanalysts, Inc. and BPA contractor). John Tenney (PTAGIS Program Manager and Software Engineer) and Nicole Tancreto (PTAGIS Data Coordinator) of Pacific States Marine Fisheries Commission (PSMFC) will be available to address any questions.

Summary

A PIT Tag Forecaster (PTF) database system has been developed to support regional PIT tag coordination efforts and to assist investigators and fishery managers. The intent of this PIT tagging coordination effort is to: 1) evaluate opportunities to improve the efficiency of PIT tag use to minimize cost and contain the numbers of fish being handled and tagged; and 2) provide input to forecasting PIT tag purchases basin-wide.

Relevance

The PTF tool will allow managers and investigators to accomplish multiple objectives toward ensuring the most efficient use of PIT-tagged anadromous fish throughout the Columbia Basin by:

- Providing a platform for various investigators and managers to view the collective planned tagging activities throughout the system in an effort to assess opportunities for sharing of tagged fish, and assist with coordinating tag use within and across watersheds.

- Maintaining adequate stock coverage to satisfy specific monitoring needs (under both the FCRPS BiOp and Fish and Wildlife Program) into the future.
- Minimizing over-tagging sensitive ESA-listed populations, as well as informing NOAA Sec. 10 take-permits.

Workplan:

Both the 2008 NOAA Fisheries FCRPS Biological Opinion and the Council's 2013 Fish Tagging Forum noted the need to improve coordination and efficiency among PIT tag users in the Columbia River Basin. As a result of consensus recommendation #3 of the Fish Tagging Forum, the Council called for the establishment of an annual coordination forum to review short-term and long-term study plans which rely on PIT tags.

In addition, the Fish Propagation strategy section of the 2014 Fish and Wildlife Program states the Council continues to support PIT tagging and detection ... to help assure adequate effectiveness monitoring, and other monitoring as necessary, throughout fish life cycles and across various fish environments.

Also, a principle in the Investment strategy section of the 2014 Fish and Wildlife Program states that Bonneville and action agencies should allocate and assure adequate funding for the application and recovery or detection of PIT tags.

Background:

An initial PIT tag database system was constructed in 2009 and resided at the University of Washington-Columbia Basin Research. The new 2014 interactive, web-based version of the PTF system was designed and developed by PSMFC and has been integrated with PTAGIS. It is expected that regional PIT tag users will populate the database in three-year time steps, yielding a three-year forecast of PIT tag needs in the basin. The key input parameters are geographic release location, numbers of tagged fish, life stage, and species/ESU/population information. The system is now functional and ready for broad, regional use. The PTF tool will be demonstrated during this presentation.

More information:

Fish managers and investigators will have access to the query and reporting features associated with the PTF database. The system has two query modes: 1) a generic query mode using a common set of filtering parameters which produces fixed graphic output; and 2) a more detailed mode that can accommodate other, more specific and complex data queries. The PTF tool also includes an online tutorial to guide users through the data entry process.

Status of the PIT Tag Forecaster (PTF)

November 2014

What is the PTF?

- Database system used to forecast Columbia Basin PIT tag use
 - Focus is currently anadromous salmonids
 - Integrated with PTAGIS
- Time step = 3 year forecast

Genesis of the PTF

- 2008 FCRPS BiOp & 2013 NPCC Tagging Forum noted the need to improve coordination and efficiency among PIT tag users region-wide.
- AA & NOAA 2013 product = “The Status & Needs of the Columbia Basin PIT Tag Information System as Related to FCRPS BiOp RME Requirements” (Salmonrecovery.gov)
 - one element was a PIT tag forecasting tool.
- NPCC Tagging Forum 2013 recommends establishment of a coordination forum for studies relying on PIT tags. Key objectives are-
 - To improve tag use efficiency and contain costs, and
 - To minimize # fish handled/tagged.
- The PTF is a forecasting tool meant to assist these efforts .

Applications of the PTF

- Ensure the efficient use of tagged anadromous salmon and steelhead throughout the Columbia Basin.
- Provide a platform for various investigators and managers to view the collective planned tagging activities throughout the system.
 - Identify opportunities for sharing of tagged fish.
 - Assist with coordinating tag use within and across watersheds
- Maintain adequate stock coverage to satisfy specific monitoring needs (BiOp & FWP) in the out-years.
- Minimize over-tagging sensitive ESA-listed populations, and inform NOAA take-permits.

History of PTF

- **2009-2010**
 - UW & BioAnalysts- prototype database & query system @CBR
 - Populated by agencies via distributed spreadsheet
- **2011-2012**
 - Dormant
- **2013-2014**
 - PSMFC redesigns system and integrates with PTAGIS
 - Beta-tested spring 2014 (FPC & Corps)
 - Regional parties/agencies have been contacted, regarding the need for populating the database.

The PTF System: two components

- Database
 - Populated online by users; update annually
 - Ideally one contact per agency, or agency coalition (e.g. FPC)
- Query & Reporting tools
 - A generic query and graphical report tool, and
 - A detailed query tool

Database information, annually by RME project

- ESU/MPG
 - ESA-listed and unlisted populations
- Release site
- Project/contract #
- Sponsor
- Contractor
- Number to be released
- Life stage
- Origin (wild/hat.)
 - Hatchery name
- RME application
- Data source

Next Steps (AA, NOAA & NPCC)

- PTF user coordination meeting being scheduled for late November.
- Specify the timeframe for populating the database. (December 31, 2014 is the proposed target)
- Engage the NPCC tagging coordination group. Provide the PTF as one tool.
- Continue refining the PTF to include graphical geo-referenced query capability.
